CBD (Cannabidiol) - CBD is only infused into products clearly marked as such.

Specific Ingredient Focus

Why Avocado Oil?

Persea Gratissima (Avocado) Oil is a very rich, highly moisturizing oil that makes the skin smooth, nourished, replenishing and visibly calming skin. It contains natural vitamins A, C, and D and antioxidant-rich vitamin E. Avocado Oil is an excellent source of skin-replenishing fatty acids, including omega-3, omega-6, oleic acid, and beta sitosterol. These work on skin's surface to preserve moisture and prevent water loss. On compromised skin, Avocado Oil has been shown to boost skin's hydroxyproline content, an amino acid that plays a key role in reinforcing the skin's barrier.

Why Menthol?

Menthol provides a cooling sensation when applied to the skin, which helps relieve pain in the tissues underneath the skin. It is used to provide relief for pain, muscles or joint pain.

Menthol topical, as a vasodilator, improves blood flow to the skin where it is applied. Additionally, it reduces the production of inflammatory cytokines and prostaglandins to help improve inflamed skin.

Why MSM?

MSM (Methylsulfonylmethane) is a natural compound found in food. It helps with skin regeneration and repair, boosts collagen production, and reduces inflammation and signs of aging. MSM can benefit all skin types.

It is highly effective treating skin conditions, including eczema, and sensitive, cracked skin. It helps to keep skin healthy and guards against skin damage.

Why CBD?

CBD (Cannabidiol) is a natural compound found in Cannabis plants. CBD is not impairing, meaning it does not cause a high. It is claimed that CBD improves blood flow.

CBD may have an anti-inflammatory effect on the skin cells that produce sebum, and it helps to reduce inflammation. As an anti-inflammatory, CBD may be able to help reduce swelling, pain, or irritation from skin conditions.

CBD is claimed to help with dry skin and other skin conditions, making it beneficial for your skin. In an article published on the USA Government's website National Library of Medicine dated 30 June 2021, it is stated that "preclinical evidence suggests topical application of CBD may be efficacious for some skin disorders, and inflammatory diseases".
